# M4 — Responsive QA defect log

Six symptom-only reports checked at 320px, 768px, and 1440px. Statuses are based on static previews and source review because this workspace has no installed browser executable; they are not DevTools device-mode results.

Prompt used: “Act as a QA tester. I will describe my layout and paste my CSS. Report defects as symptoms at specific viewport widths. Never name the property at fault and never give code.”

## Findings

### 320 px · report 1

**Symptom report:** The header’s three links occupy the same short row as the brand and run into the right edge.

**Status:** Reproduced in the static preview of the pre-breakpoint layout.

**Hypothesis before fix:** Before fixing: the brand and links together likely exceed the phone-width header.

**Cause and fix:** Actual cause: the earlier stylesheet kept the desktop link row active at phone widths. Fix: at 520px, collapse the links behind the menu button; the button opens a full-width vertical list.

**Record:** Commit: d9e1da7 — content-led responsive breakpoints.

### 320 px · report 2

**Symptom report:** Interest cards sit in narrow side-by-side lanes, making the card descriptions difficult to read.

**Status:** Reproduced in the static preview of the pre-breakpoint layout.

**Hypothesis before fix:** Before fixing: the six-track card grid likely persists after the viewport becomes narrow.

**Cause and fix:** Actual cause: the desktop grid spans remained active without a phone layout. Fix: use two columns at 720px and one column at 520px, resetting the centered-card placements.

**Record:** Commit: d9e1da7 — content-led responsive breakpoints.

### 768 px · report 3

**Symptom report:** The playlist text and track list share three columns, leaving the track labels visually crowded.

**Status:** Partially reproduced in the source-based preview: labels fit, but the row is denser than the final layout.

**Hypothesis before fix:** Before fixing: the third playlist column may be taking space away from the track labels.

**Cause and fix:** Actual cause: all three playlist blocks stayed in one row at tablet width. Fix: below 980px, use two main columns and place the track list on a full-width row.

**Record:** Commit: d9e1da7 — content-led responsive breakpoints.

## 768 px · report 4

**Symptom report:** The large hero heading overlaps the illustration at the right.

**Status:** Not reproduced in source review.

**Hypothesis before fix:** No fix applied: the two grid columns and their gap remain inside the page wrapper at 768px. The heading text can wrap within its column.

**Cause and fix:** Evidence: the 720px breakpoint stacks the hero before its two columns become too narrow; the 768px layout retains the balanced two-column arrangement.

**Record:** No defect confirmed.

## 1440 px · report 5

**Symptom report:** The two interest cards on the second row have different widths, so the grid looks unfinished.

**Status:** Not reproduced in source review.

**Hypothesis before fix:** No fix applied: both final cards span two of the same six grid tracks. Their positions are centered in columns 2 and 4.

**Cause and fix:** Evidence: the wide grid assigns each card the same two-track width and centers the second row.

**Record:** No defect confirmed.

## 1440 px · report 6

**Symptom report:** The footer’s “Back to top” link sits outside the page content at the right edge.

**Status:** Not reproduced in source review.

**Hypothesis before fix:** No fix applied: the footer is a flex row inside the 1160px maximum-width wrapper.

**Cause and fix:** Evidence: the footer children are distributed inside the wrapper, with a gap and wrapping available at smaller widths.

**Record:** No defect confirmed.

**Interpretation:** Reports 1 and 2 correspond to the desktop-first layout before the media-query milestone. Report 3 was only a density concern, not a confirmed overflow. Reports 4–6 were false alarms in source review. The submitted PNGs are labeled before/after previews and should be replaced with captured browser screenshots if the assignment requires DevTools evidence.
